Essays on the economics of disease control and child malnutrition

Determining the benefits of infectious diseases control can provide the impetus for policy makers to prioritize disease control, but this requires knowledge about how control measures affect disease outcomes and how to monetize these outcomes, so that disease control can be viewed as a benefit rather than a cost. The first part of this dissertation investigates how preventative canine rabies vaccination affects human rabies post-exposure prophylaxis (PEP) demand and human rabies deaths. It begins by estimating a mean (median) value of a statistical life (VSL) of approximately US $128,000 ($54,000) from the human rabies PEP demand decision following an animal attack in an area where rabies is endemic using contact-tracing data from the Serengeti District of Tanzania for the years 2002 to 2007. This is followed by developing and calibrating an economic model of canine rabies control that incorporates the benefits of control in terms of reductions in human PEP and human rabies deaths valued by the VSL. The model suggests that dog vaccination provides large benefits at low vaccination coverage levels, even if PEP demand increases with dog vaccination. This suggests that investing in dog vaccination provides large returns. The second part of this dissertation investigates the determinants of improvements in child nutrition in Paraguay between the years 2005 and 2012 using an Oaxaca decomposition technique. Before 2005, Paraguay observed a high stunting prevalence and one of the highest rural-urban child malnutrition differentials in the world. Yet by 2012, it had reduced stunting prevalence by more than half, with rural-urban child malnutrition differentials that were among the lowest in the world.
When I publish my dissertation, do I lose copyright?

- You retain copyright when signing with ProQuest and Research Exchange
- This means: you retain the right to distribute your work online, make derivatives, make copies, and perform your work publicly
- ProQuest and Research Exchange ask you to sign a “non-exclusive” license granting ProQuest and the WSU Libraries the right to distribute your work online. This does not negate your copyrights.
What are the advantages of publishing openly?

• Wider audience for your research
  ▪ The 920 dissertations in Research Exchange have been downloaded more than 300,000 times since 2011.

• Potential impact on real-world policy
  ▪ Public policy makers, educators, health care professionals, developing countries, etc., can access your work without paying subscription costs

• Increased professional opportunities
  • Publishers, academics, employers can find your work and further opportunities may open up (writing partnerships, book deals, job opportunities, interest from graduate programs)
Won’t I lose publishing opportunities by choosing open access?

• See the American Historical Association recommendation to embargo history dissertations for six years

• 2011 survey reported that only 2.9% of publishers will not consider publishing a thesis/dissertation that’s available online (“Do Open Access ETDs Diminish Publishing Opportunities in the Social Sciences and Humanities?” C&RL, July 2013).

• Sharing your work online may create more buzz—more publishing opportunities. More research needed.
