

Class A Weeds: Non-native species whose Washington distribution is still limited. Eradication and prevention are the highest priorities.
Eradication of all Class A plants is required by law.

Class B Weeds: Non-native species presently limited to portions of the State. Species are designated for control in regions where they are not yet widespread. Preventing new infestations in these areas is a high priority. In regions where a Class B species is already abundant, control is decided locally, with containment as the primary goal.

Class C Weeds: Noxious weeds that are typically widespread in WA or of special interest to state agriculture. Class C status allows counties to require control if locally desired, or choose to educate or provide technical consultation instead.

Noxious Weeds are non-native plants introduced to Washington State that can be highly destructive, competitive, and difficult to control. These plants invade our croplands, rangeland, forests, parks, rivers, lakes, wetlands and estuaries, causing both ecological and economic damage that affects us all. Noxious weeds can:

- Lower crop yields
- Reduce forage quality
- Destroy plant and animal habitat
- Displace native plants
- Reduce recreational opportunities (e.g., fishing, hunting, swimming and hiking)
- Clog waterways
- Decrease land values
- Increase erosion and wildfire risk
- Inflict toxic reactions in humans, livestock, and pets

Please help protect Washington's economy and environment from noxious weeds!

To help protect the State's resources and economy, the Washington State Noxious Weed Control Board adopts a State Noxious Weed List each year (WAC 16-750). This list classifies weeds into three major classes (A, B, and C) based on the stage of invasion of each species and the seriousness of the threat they pose to Washington State. This classification system is designed to:

Prevent small infestations from expanding by eradicating them when they are first detected

Restrict already established weed populations to regions of the state where they occur and prevent their movement to un-infested areas

Allow flexibility of weed control at the local level for weeds that are already widespread.
