Sally Holmes  
Henry Hudson

### Light Yellow

Golden Wings

### Deep Pink

William Baffin

### Medium Pink

Ballerina  
Morden Centennial

### Light Pink

Pink Meidland  
Bonica

## OWN-ROOT VS. GRAFTED ROSES

A grafted rose is one in which a scion of a desired variety is attached, or grafted, onto a rootstock. This results in a plant that combines the desirable survival and hardiness traits of the rootstock variety with the desired aesthetic qualities of the scion variety.

Grafting allows for a hardy and inexpensive variety of roses, but it does come with some problems. One potential downside to grafted roses is that if the grafted variety and the canes attached to it die, that grafted variety is gone. The rootstock, which has undesirable aesthetic qualities, may begin to grow at that point, or it may even send out its own suckers while the grafted variety is still alive.

Romantica Roses from Meiland of France, Griffith Buck Rose, and English Legend Roses By Harkness of England are organizations that have developed and continue to develop roses grown on their own roots. They are known as own-root roses.

Own-root roses are rapidly gaining popularity because they have greater winter hardiness and are less apt to have viruses (the grafting process represents a potential disease vector). In addition, own-root roses can live for upwards of 50 years or more, compared to the approximately 15-year lifespan of grafted roses.

For more information on rose planting and care, see Factsheet C123: [Rose Culture](#).
