

## "T" is for Tulip

Tulip is the common name for any member of a genus of spring-flowering, bulbous herbs, of the lily family. Native to Asia and the Mediterranean region, there are about 80 species and thousands of varieties. The plants are erect with long, broad, parallel-veined leaves and cup-shaped, solitary flowers borne at the tip of the stem. The flowers are either single or double and occur in a wide range of solid colors. Broken tulips, showing a flame pattern, are the result of a viral disease carried and transferred to the plants by aphids.

The Dutch brought the tulip to Europe from Constantinople in 1593. Specialists, who sold their product for very high prices controlled the growing of tulips until 1630. The trading in tulips then increased and in 1636 and 1637 'tulipomania' ruled the land. Bulbs became a type of currency with a daily fluctuating value which was quoted much as we quote stocks. Everyone wanted to become a bulb grower. One bulb of the Vice-Roi variety, sold for thirty-six bushels of wheat, seventy-two bushels of rice, four oxen, twelve sheep, eight pigs, two barrels of wine, four barrels of beer, two tons of butter, a thousand pounds of cheese, a bed, clothes, and a silver cup for a combined value of 2,500 Dutch guilders. There was no regulation of the tulip trade. Bulbs were sold faster than they could grow. Prices spiraled to ridiculous levels for bulbs whose flower had not been seen. The bulb growers finally asked the government to ban the trade. The market finally collapsed in 1637, similar to the stock market crash of the 20's. Overnight fortunes were lost, people committed suicide and the paper was sold off at rock bottom prices.

In the entire world, 43 tulip books from this period are known to exist. Each one is a manuscript made by a different illustrator. Of these books, 34 were made in the Netherlands during the first half of the seventeenth century. The tulip book of nurseryman P. Cos of Haarlem is a manuscript nursery catalogue of tulips and a small number of other flowers, published in 1637 and owned by the Wageningen UR Library. The book names each tulip, gives its weight and selling price. The two most expensive were sold for *f* 3,000 and *f* 4,200 or about 1.5 to 2 million dollars.

The growing of tulips is still an important Dutch industry. They are also grown commercially in Michigan, Washington and Oregon. The [Skagit Valley Tulip Festival](#) in Washington State is held in April each year. Closer to home, south of Portland Oregon, [Wooden Shoe Bulb Company](#) also hosts a festival in the spring. Need to see some tulips before spring? You can visit the [Wynyard Tulip Festival](#) from October 6th to 13th in Australia.

In the fall, plant your tulips 4-5 inches deep about 6 inches apart in full sun. Taller varieties should be planted 8 inches deep. They like a rich sandy alkaline soil with good drainage. There is a flat side on a tulip bulb. If you plant this facing outward, the largest leaf will face in that direction. Climate is crucial to the success of tulips. They require warm dry summers and cold winters. If your garden hosts squirrels, gophers, deer or rabbits, plant the bulbs in a wire cage.

When the plants are above ground and again a month later, fertilize the bed with two pounds of 5-5-5 or a similar fertilizer per 100 square feet. Seed production will take food away from the developing bulbs so remove old

flowers. Leave the leaves free until they wither and then cut them. Tulip bulbs form offsets that take a few years to reach blooming size. As the offset matures, it draws energy from the mother bulb, which then doesn't bloom. If you treat bulbs as annuals, you are guaranteed top-quality blooms each year. You also don't have to fertilize or look at the yellow leaves. When the flower is done, remove the bulb and put it on the compost pile.

If you cut the flowers, use a sharp knife and recut the stem under water to prevent the intake of air into the stem. Taking leaves will weaken the bulb. Unlike most flowers, tulips keep growing in the vase – sometimes as much as an inch or more after being arranged. Tulips will bend and twist as they "dance" in response to the effects of stem growth, gravity and sunlight. Keep them away from sources of heat – including direct sunlight, lamps, and television sets. Do not add daffodils to your bouquet. The daffodil exudes a substance into the water which will kill the tulip.

There are 15 major groups of tulips. They are classified according to their flower characteristics.

Example	Description	Flowering Season
	<p><b>Single early</b> – single-flowered with short stems</p>	Early
	<p><b>Double Early</b> – double flowers with short stems</p>	Early to mid
