

SCENARIO 4

You are evaluating a spray program your premium 10-acre *Vitis vinifera* 'Cabernet Sauvignon' vineyard located in Napa Valley, CA. Your vineyard is 15 years old, in premium production at 3 tons/acre. Unfortunately, you had a crop-loss this year due to powdery mildew, and you are trying to figure out where things went wrong.

Phenology: Budbreak: April 1; Bloom: May 15; Véraison start: July 25; Harvest: September 25.

Weather: Spring was warm and dry, with an earlier-than normal budbreak. These pleasant conditions continued through bloom, followed by a late June heat spike. After that, weather remained optimal for vine growth and development, and the vintage proceeded into late summer and early fall warm and dry conditions.

Spray Program:

Date	Product	Rate per acre	Water volume
10-Apr	JMS Stylet Oil	2%	50 gal
24-Apr	JMS Stylet Oil	2%	50 gal
8-May	Quintec Microthiol Disperss	6.6 fl oz 4.0 lbs	50 gal
30-May	Luna Experience	6.0 fl oz	50 gal
20-Jun	Torino JMS Stylet Oil	6.8 oz 0.5%	75 gal
4-Jul	Aprovia	8.6 fl oz	75 gal
30-Jul	Vivando	15.4 fl oz	75 gal

Spray Coverage:

You had calibrated your over-the-row multi-head fan sprayer at the start of the season, and re-calibrated every time you changed your gallons-per-acre delivery. Each year, you do a general mid-season (bloom) coverage check using water sensitive paper, located throughout the canopy (upper canopy, lower canopy, exterior to the canopy and interior to the canopy).
