

My boss Tricia and I headrow harvesting this past august. (not technically during my internship but marks the beginning of post-harvest).

WINTER WHEAT PROGRAM PULLMAN, WA LUKE BENTON , FALL 2019

This was the seed cleaner used to clear chaff and other excess plant material from the seed.

This research is important to the agricultural industry and especially northwest wheat farmers because our program has developed lines of wheat that have reduced inputs largely and have increased yields, quality, and many more benefits that have allowed farmers all across Washington and even some parts of the world a chance to grow quality grain. All why trying to use sustainable methods and tips for these farmers, so their soil stays healthy.

Here are how storage samples are kept. The room is kept cold and its ID is on the lid and side of jar.

This work will aid in my transition to the agricultural industry. Not only the physical work itself but the responsibilities put upon me and the trust instilled that I would complete it. Being able to complete those tasks handed to me and to complete them the right way gives me the confidence to approach my next job in the agricultural industry.

McGregor M-90 formula (fungicide/insecticide used to treat seed).

Seedouse backroom after it had been cleaned and organized.
