II. Dewey Scientific is a Cannabis Company that focuses on developing medicinal CBD products as well as some recreational products. Dewey does many things such as Phenotype hunting and tissue culture to fin expressed traits in certain cultivars/strains.

III. I performed many tasks throughout my internship. Some of the main tasks were; tissue culture, mixing nutrients with a soil-like media, transplanting, and many small chores as well. My favorite would be tissue culture as it is amazing to see the results of certain genetic traits. I also really enjoy mixing nutrients and soil because it helps me understand the fertilizer ratios and so on. Transplanting is also very relaxing for me, so I enjoy that as well.

IV. My overall experience was great, and I managed to accomplish some of the goals I had set for myself since the beginning. For example, I was able to test for certain genetics as well as learning that genetic traits can pop up throughout time. I also got to learn more about greenhouse management, not only that, but I worked hands on and that was a good learning experience. There are different nutrients required throughout the stages of a plants’ life cycle, learning this was also something that I am thankful for. Working hands on really helped me see the actual process of growing a plant from seedling to death. All these things are going to help me for many years to come as I want to work in a greenhouse for my future career plans. I also now have professors and co-workers I can ask for help if it is ever needed.
