

ASCENT Project 59B

A059B – Experimental Supersonic Jet Noise Reduction

(Original Title: Jet Noise Modeling and Measurements to Support Reduced LTO Noise of Supersonic Aircraft Technology Development)

Georgia Institute of Technology

PI: Krish Ahuja (PI), D. Mavris and Jimmy Tai (Co-PIs)

Experimental support: Aharon Karon, Robert Funk and Nate Ramsey (GTRI)

Cost Share Partner: Gulfstream (POC: Brian Cook)

PM: Sandy Liu

Research Approach:

- Design and fabricate a simple model-scale test nozzle made of a round core primary nozzle buried in a coaxial secondary flow with the mixed flow exhausting some distance downstream of the primary nozzle exit.
 - Geometry was designed as a scaled model of a paper engine design
- Acquire acoustic and related flow measurements as a function of mixing distance between the primary nozzle exit and the final exhaust nozzle exit
- Provide the measured data to modeling teams for validation of prediction codes

Objective:

To acquire acoustic and flow measurements to be used by Project 59 jet noise modelers for the validation of low, medium, and high-fidelity jet noise prediction methods for supersonic transport applications (SST).

Project Benefits:

The validation of these prediction codes will give confidence in the noise prediction, which will aid in the design of low noise engines for reduced landing and takeoff noise of supersonic aircraft

Major Accomplishments (to date):

- The test nozzle designed and fabricated
- The model design shared with the modelers
- Acoustic data measured for approximately 400 out of 475 $((49+7)*2*4)$ setpoint-configuration pairs. Selected small extraction ratio measurements still needed

Future Work / Schedule:

- Fix Flow facility after major structural failure
- Measure remaining acoustic and flow data
- Share all data with modelers and be available for interactions
- Select year 2 mixer design

ASCENT #59B Test Hardware and Setups

(a) Model in GTRI Anechoic Jet-Facility ($L_e/D_e = 0.7$) (b) with acoustic treatment

Cross-section view of nozzle assembly. Mixing length (L_e) varied using different spacers.

Coordinate conventions used throughout

The model of a 0.045 scale of the paper engine

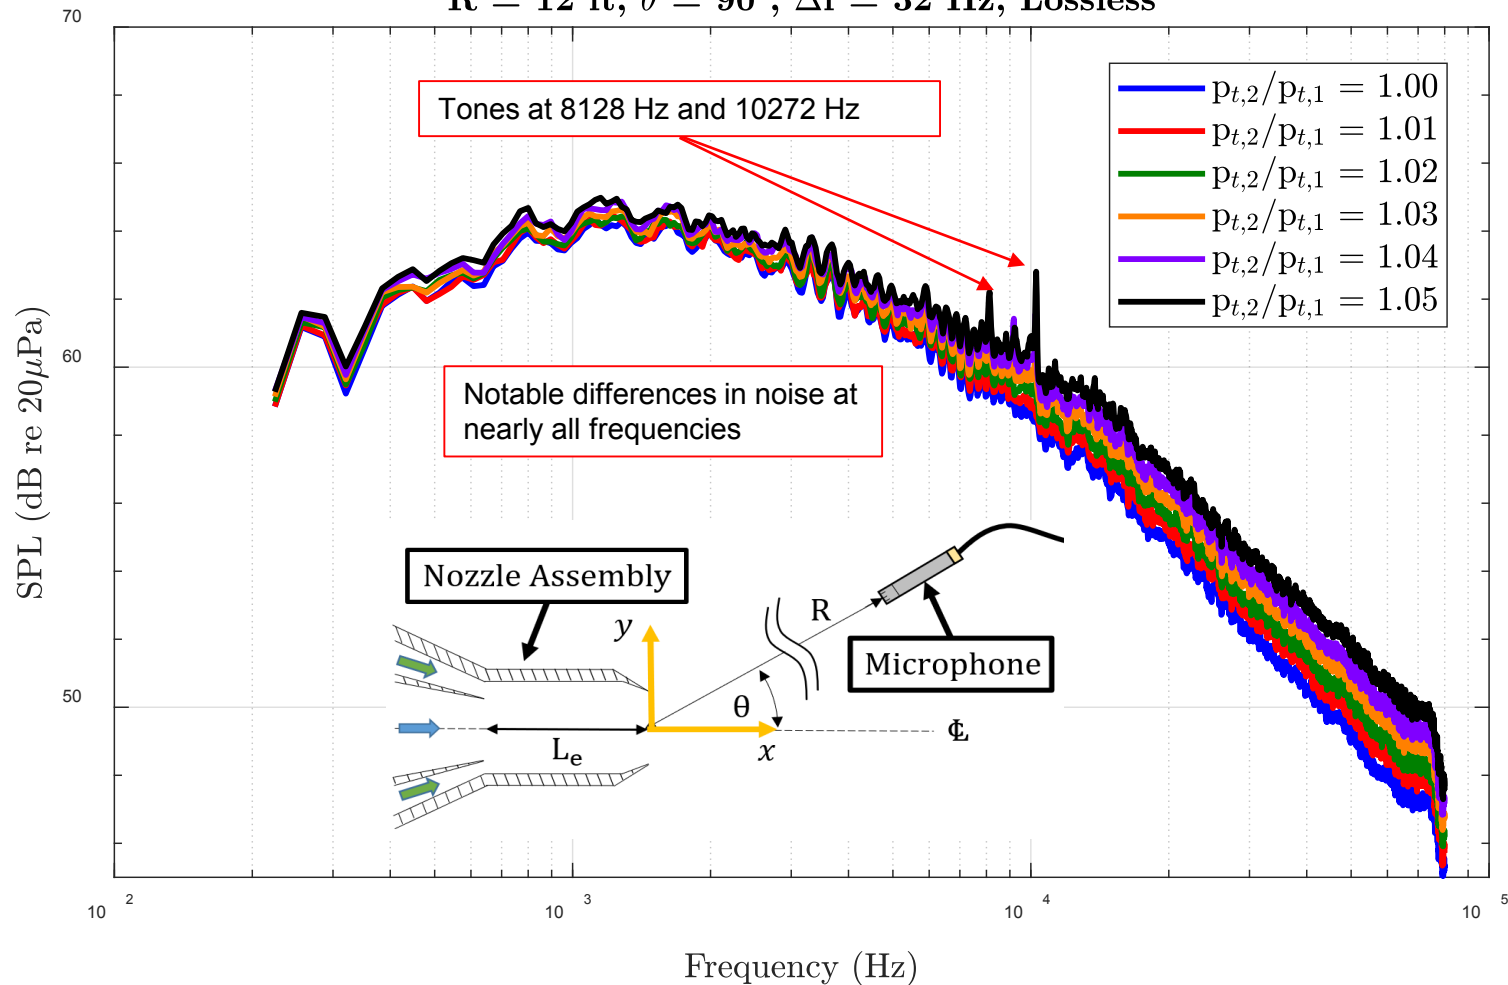

Model in GTRI Flow Diagnostic Facility Set Up for PIV ($L_e/D_e = 3.0$)

Effect of Extraction Ratio, Pr_2/Pr_1 ($\theta = 90^\circ$ Unheated Core)

Effect of Small Extraction Ratios On Jet Noise
Nozzle: FAA Project Model, $D_e = 1.7$ in, $L_e/D_e = 1.0$

$PR_1 = 1.39$, $T_{t,1} = T_{t,2} \approx 65^\circ\text{F}$

$R = 12$ ft, $\theta = 90^\circ$, $\Delta f = 32$ Hz, Lossless

Effect of Extraction Ratios on Farfield Jet Noise Spectra at various Polar Angles

- These tones persist in the unheated case from 50 to 110 degrees.

Effect of Small Extraction Ratios On Jet Noise
Nozzle: FAA Project Model, $D_e = 1.7$ in, $L_e/D_e = 1.0$
 $PR_1 = 1.39$, $T_{t,1} = T_{t,2} \approx 65^\circ\text{F}$
 $R = 12$ ft, $\theta = 90^\circ$, $\Delta f = 32$ Hz, Lossless

Effect of Small Extraction Ratios On Jet Noise
Nozzle: FAA Project Model, $D_e = 1.7$ in, $L_e/D_e = 1.0$
 $PR_1 = 1.39$, $T_{t,1} = T_{t,2} \approx 65^\circ\text{F}$
 $R = 12$ ft, $\theta = 50^\circ$, $\Delta f = 32$ Hz, Lossless

Effect of Small Extraction Ratios On Jet Noise
Nozzle: FAA Project Model, $D_e = 1.7$ in, $L_e/D_e = 1.0$
 $PR_1 = 1.39$, $T_{t,1} = T_{t,2} \approx 65^\circ\text{F}$
 $R = 12$ ft, $\theta = 110^\circ$, $\Delta f = 32$ Hz, Lossless

Effect of Extraction Ratio and Core flow Temperature ($\theta = 90^\circ$)

Unheated Core

Heated Core

Effect of Small Extraction Ratios On Jet Noise
Nozzle: FAA Project Model, $D_e = 1.7$ in, $L_e/D_e = 1.0$
 $PR_1 = 1.39$, $T_{t,1} = T_{t,2} \approx 65^\circ\text{F}$
 $R = 12$ ft, $\theta = 90^\circ$, $\Delta f = 32$ Hz, Lossless

Effect of Small Extraction Ratios On Jet Noise
Nozzle: FAA Project Model, $D_e = 1.7$ in, $L_e/D_e = 1.0$
 $PR_1 = 1.39$, $T_{t,1} = 500^\circ\text{F}$, $T_{t,2} \approx 65^\circ\text{F}$
 $R = 12$ ft, $\theta = 90^\circ$, $\Delta f = 32$ Hz, Lossless

Effect of Small Extraction Ratios On Jet Noise
Nozzle: FAA Project Model, $D_e = 1.7$ in, $L_e/D_e = 0.7$
 $PR_1 = 1.69$, $T_{t,1} = T_{t,2} \approx 65^\circ\text{F}$
 $R = 12$ ft, $\theta = 90^\circ$, $\Delta f = 32$ Hz, Lossless

Effect of Small Extraction Ratios On Jet Noise
Nozzle: FAA Project Model, $D_e = 1.7$ in, $L_e/D_e = 0.7$
 $PR_1 = 1.69$, $T_{t,1} \approx 500^\circ\text{F}$, $T_{t,2} \approx 65^\circ\text{F}$
 $R = 12$ ft, $\theta = 90^\circ$, $\Delta f = 32$ Hz, Lossless

Farfield Directivity as a Function of Extraction Ratio

Unheated Core

Effect of Small Extraction Ratios On Jet Noise Directivity
Nozzle: FAA Project Model, $D_e = 1.7$ in, $L_e/D_e = 1.0$
 $PR_1 = 1.39$, $T_{t,1} = T_{t,2} \approx 65^\circ\text{F}$
 $R = 12$ ft, Lossless

- Unheated Core:
 - OASPL increases at all angles: less than 1 dB difference in the rear arc and up to 2 dB increase in forward arc (from $ER = 1$ to 1.05)
- Heated Core:
 - Below $\theta = 70^\circ$, the OASPL is identical for all ER, above the OASPL differences are less than 1 dB

Heated Core

Effect of Small Extraction Ratios On Jet Noise Directivity
Nozzle: FAA Project Model, $D_e = 1.7$ in, $L_e/D_e = 1.0$
 $PR_1 = 1.39$, $T_{t,1} = 500^\circ\text{F}$, $T_{t,2} \approx 65^\circ\text{F}$
 $R = 12$ ft, Lossless

Directivities for 10 out of over 400 measured setpoints

Effect of Core Flow Temperature

Spectral Comparison @ $\theta = 90^\circ$

Directivity

- Rear angles show much larger increases than forward angles
- Results in steeper directivity

Effect of Mixing Length L_e/D_e on Farfield Jet Noise Spectra at $\theta = 90^\circ$

Unheated Core

Effect of L/D on the Jet Noise Generated from the Two-stream FAA Project Model

Nozzle: FAA Project Model, $D_e = 1.7$ in

$PR_1 = PR_2 = 1.39$, $ER = 1.0$, $T_{t,1} = T_{t,2} \approx 60^\circ\text{F}$

$R = 12$ ft, $\theta = 90^\circ$, $\Delta f = 32$ Hz, Lossless

Heated Core

Effect of L/D on the Jet Noise Generated from the Two-stream FAA Project Model

Nozzle: FAA Project Model, $D_e = 1.7$ in

$PR_1 = PR_2 = 1.39$, $ER = 1.0$, $T_{t,1} = 500^\circ\text{F}$, $T_{t,2} \approx 60^\circ\text{F}$

$R = 12$ ft, $\theta = 90^\circ$, $\Delta f = 32$ Hz, Lossless

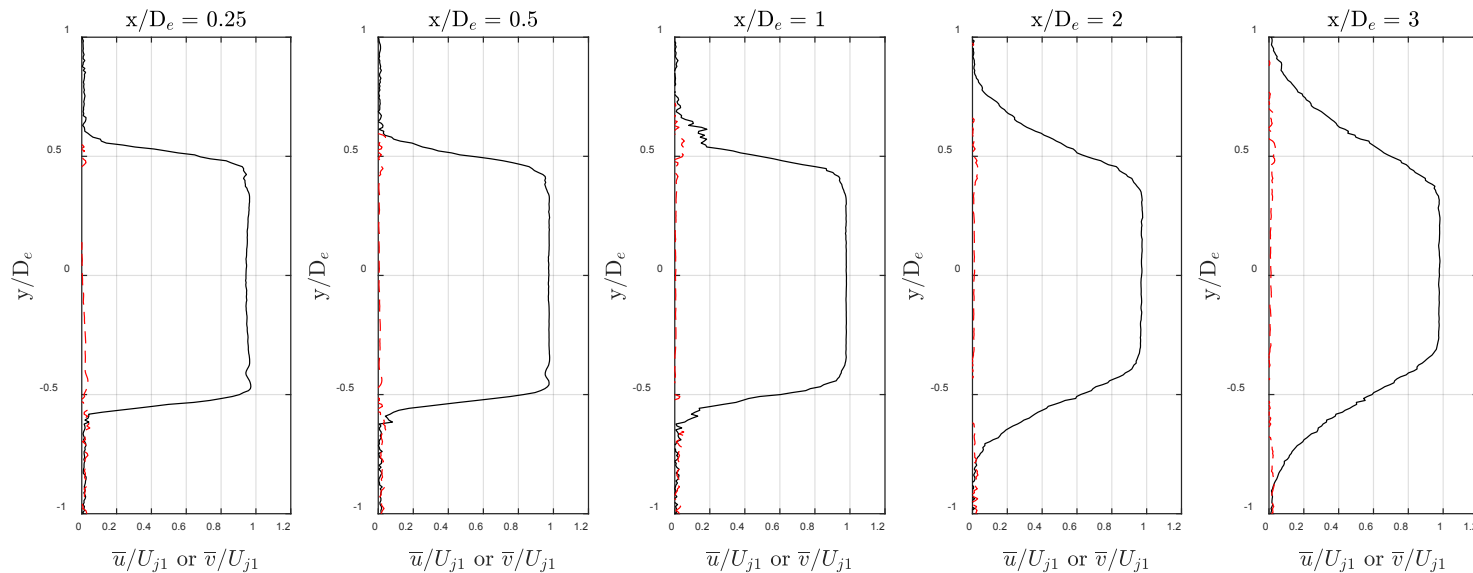

- Unheated Case: Above 8 kHz (vertical red line), there is 1-2 dB reduction when the L_e/D_e is increased from 0.7 and 2.0
- Heated Case: No appreciable high-frequency difference between all L_e/D_e

Typical PIV Data:

Mean velocity distribution

Normalized Mean Velocity at Various x/D_e
 Nozzle Configuration: $L_e/D_e = 0.7$, $D_e = 1.7$ in
 $PR_1 = 1.39$, $ER = 1$, $PR_2 = 1.39$, Unheated

Mean velocity profiles acquired at GTRI using PIV

Major Structural Failure of the Flow Facility

Cross-section of primary plenum and nozzle assembly in Flow Diagnostic Facility (secondary plenum not shown)

(a) **View A**. Liberated chunk of insulation in primary nozzle (outer nozzle removed) (b) view at **Section B-B**. Insulation collapse inside plenum viewed downstream (nozzle assembly removed)

Concluding Comments

Major Accomplishments (to date):

- The test nozzle designed and fabricated
- The model design shared with the modelers
- Acoustic data measured for approximately 400 out of 475 $((49+7)*2*4)$ set point-configuration pairs. Selected **small** extraction-ratio measurements still needed
- PIV methodology has been thoroughly investigated and will require long duration measurements to get smooth curves.

Planned Work

- Repair Flow facility
- Maintain unheated capability in the interim
- Acquire remaining acoustic and flow data
- Share all data with modelers and be available for interactions
- Select year-2 mixer design

BACK UP SLIDES

Typical PIV Data:

Boundary Layer Profile Validation

- Primary flow only (no mixing duct or exhaust nozzle)
- PIV profile taken slightly downstream of nozzle exit plane

Typical PIV Data:

Centerline turbulence

- Turbulence statistics follow trend observed in literature in this case; in shear layer, measured turbulence is too high.
- Possible issues (laser head misalignment and too small of a sample size) will be addressed

Turbulence intensity acquired at GTRI

Summary of reference turbulence intensity data compiled by Bridges and Wernet*

Test Matrix

- Farfield acoustics are measured for heated and unheated setpoints
- PIV and Source Localization/Schlieren will be restricted to unheated setpoints
- Four internal mixing lengths ($L_e/D_e = 0.7, 1.0, 2.0, 3.0$)

Farfield acoustics

White checks: Measurement complete. For small ER (bottom half of chart), acoustics measured only for $L/D = 1.0$ configuration, other mixing lengths remain to be done. Repeats being conducted for $L/D = 0.7$ due to unusual microphone response.

Examples of Unexpected Tones at Non-unity Extraction Ratios

Jet Noise Generated from the Two-stream FAA Project Model

Nozzle: FAA Project Model, $D_e = 1.7$ in, $L_e/D_e = 3.0$

$T_{t,1} = T_{t,2} = 60^\circ\text{F}$, $R = 12$ ft, $\theta = 90^\circ$, $\Delta f = 32$ Hz, Lossless

Spectra for 3 out of over 400 measured setpoints

Effect of Mixing Length L_e/D_e on Farfield Jet Noise Spectra at $\theta = 90^\circ$

Unheated Core

Effect of L/D on the Jet Noise Generated from the Two-stream FAA Project Model

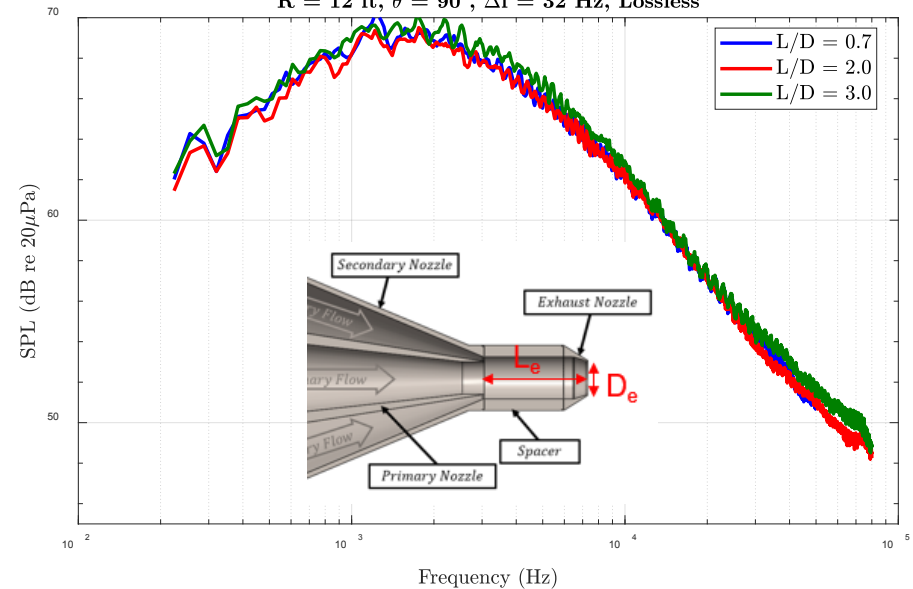

Nozzle: FAA Project Model, $D_e = 1.7$ in
 $PR_1 = PR_2 = 1.39$, $ER = 1.0$, $T_{t,1} = T_{t,2} \approx 60^\circ\text{F}$
 $R = 12$ ft, $\theta = 90^\circ$, $\Delta f = 32$ Hz, Lossless

Heated Core

Effect of L/D on the Jet Noise Generated from the Two-stream FAA Project Model

Nozzle: FAA Project Model, $D_e = 1.7$ in
 $PR_1 = PR_2 = 1.39$, $ER = 1.0$, $T_{t,1} = 500^\circ\text{F}$, $T_{t,2} \approx 60^\circ\text{F}$
 $R = 12$ ft, $\theta = 90^\circ$, $\Delta f = 32$ Hz, Lossless

- Unheated Case: Above 8 kHz (vertical red line), there is 1-2 dB reduction when the L_e/D_e is increased from 0.7 and 2.0
- Heated Case: No appreciable high-frequency difference between all L_e/D_e

Spectra for 6 out of over 400 measured setpoints

GTRI Anechoic Chamber and the Flow Diagnostic Facility

Anechoic Jet Facility

- Farfield acoustic spectra at 10-degree increments (30 degrees through 120 degrees)

Flow Diagnostic Facility

- Flow field characterization using PIV
- Jet source localization
- High-speed Schlieren photography

GTRI's dual-stream jet facilities used for ASCENT #59B with relevant capabilities listed
