IS SLEEP APNEA IMPACTING YOUR ABILITY TO FOCUS?

Are you struggling with memory, attention, and concentration?

The SHARP* Study is investigating an approved study medication for people who have excessive daytime sleepiness associated with obstructive sleep apnea (OSA).

OSA is a condition in which your breathing stops while you are asleep, and you have to wake up to continue breathing.

The SHARP Study will explore whether the study medication improves your cognition, which can include your memory, attention, and concentration.

You or someone you care for may be able to take part if you/they:

- are 18–65 years of age
- have been diagnosed with sleep apnea, have difficulties staying awake during the day, and have problems with memory or attention
- normally sleep for more than 6 hours at night.
